

Unit 3D – Exploring Simulations

Level 3

Pupils begin to organise their task and use ICT to create, organise, amend and present information and ideas. They find information from a range of given sources and use ICT to search, sort and/or graph data to follow simple lines of enquiry. They begin to collect data and understand how changing one thing affects another in models and simulations. They recognise the different parts of a computer system.

Teacher commentary:

In this unit children examine how on screen simulations can be used to mimic events that happen in the real world. They consider benefits and draw backs of this method. Eg Science experiments can be explored safely and quickly; however they are not subject to the real world and real variations. They are observations of someone elses experiment.
